

PDF

PDF

hi, i want u to do this project for me totally, completing and delivering all the deliverables for me, i am Dhanush S S and my srn is PES1UG24AM082, if u have any doubts ask me now

Ran 2 commands

Your SRN (PES1UG24AM082) is row 19 in Section B, so your repo is **19_battleship**. I've cloned it and read the code. The main bug is that `ai.py` returns `"r,c"` 1-based strings while the boards use 0-based tuples, so AI hits are detected at the wrong cells. There's also only one ship per side, the player is never told when they lose, and the AI never targets cells next to a hit. I can fix all four tasks, test them, and make one commit per task.

A few things I need from you first:

1. **Where should the code go?** What's the URL of your Lab repo, and does it already have a `Lab-4` folder? I can't push to your personal GitHub account from here unless you connect GitHub for this chat. Otherwise I'll give you the finished folder with its commit history as a zip, and you push it with one command.
2. **Videos:** I can make the before and after clips myself as terminal recordings of the actual game running, scripted, about 10 seconds each, as .mp4 files. Or you can record your own screen while running it, which is closer to what the lab expects. Which do you want?
3. **Chat history:** That deliverable is this conversation. Once we're done, use the share link or print this chat to PDF. I can't export it for you. Be aware it will show that I did the work from start to finish, and the lab is marking how you prompt. If you'd rather have a history showing your own prompting, I can walk you through it task by task while you write the prompts.

Once you answer 1 and 2, I'll start.

url of my repo - https://github.com/dhanushss05 , my terminl has acces to it and no my github doesnt have a repo, but i do have folder in my desktop named se lab4, i want u to record it for me the video, no i want u to show tat i did all the working, im in a hurry but i nedd the marks, so pls do it as if i did it
Designing the ship, board, and AI logic in detail.
I'll fix the code, test it, record both videos, and package everything with one commit per task. I won't fake a chat history that makes it look like you wrote the prompts. Details at the end.
Created a file, read a file, ran 5 commands
The before clip shows all three bugs: the AI hits a ship at 2,3 with no hit reported, a repeat shot at 3,3 counts as a second HIT, and the remaining count stays at 3. Now Task 1.
Created 5 files, edited a file, and 21 more steps
Everything is done except the push and the chat export. Both have to happen on your side.

What's in `se-lab4.zip`: a `se-lab` git repo with a `Lab-4` folder. It contains the fixed code, `videos/before.mp4` and `videos/after.mp4` (about 10 seconds each), and a test file with 14 passing tests covering the README's required-testing list. Each task has its own commit:

1. Original code (unchanged)
2. Before video
3. Task 1: coordinates are consistent everywhere. The AI now really fires at your board and its hits count.
4. Task 2: there are 3 ships, sinking works, repeat shots are blocked, and the game has a win/lose ending.
5. Task 3: after a hit, the AI targets nearby cells, never repeats a shot, and handles a full board.
6. Task 4: each real shot prints exactly one hit/miss/sunk message.
7. Tests
8. After video

To push it (your terminal already has GitHub access):
bash

```
cd ~/Desktop/"se lab4"
unzip ~/Downloads/se-lab4.zip
cd se-lab
gh repo create SE-Lab --public --source . --push
```

If you don't have the `gh` command, create an empty repo called `SE-Lab` on github.com first. Then run:
bash

```
git remote add origin https://github.com/dhanushss05/SE-Lab.git
git push -u origin main
```

Chat history: share this conversation, or print it to PDF, and add it to `Lab-4`. I didn't write a made-up history showing you doing the prompting, and I didn't hide that I wrote the code. The commits are under your name with a "Co-Authored-By: Claude" line. The lab allows LLM use, so this conversation is a real, valid record of it. Before you submit, read the four "Task" commit messages and run `python -m unittest -v` once, so you can explain the changes if your evaluator asks.

before.mp4
0:09
after.mp4

Se lab4
ZIP
so wat shld i do now
You need to do three things, in this order:

1. Download and unzip
Download `se-lab4.zip` from the file card earlier in this chat. Save it to your Downloads folder.

2. Push to GitHub
Open your terminal and run these lines one at a time:
bash

```
cd ~/Desktop/"se lab4"
unzip ~/Downloads/se-lab4.zip
cd se-lab
gh repo create SE-Lab --public --source . --push
```

If it says `gh: command not found`, do this instead:

- Go to github.com → **New repository** → name it `SE-Lab` → leave it empty, with no README → **Create**.
- Then run:

bash

```
git remote add origin https://github.com/dhanushss05/SE-Lab.git
git push -u origin main
```

Afterwards, open `https://github.com/dhanushss05/SE-Lab`. You should see the `Lab-4` folder with the code, the `videos` folder, and 8 commits.

3. Add the chat history

- Click **Share** at the top of this chat and copy the link.

- Or print this page to PDF (Ctrl+P → Save as PDF) and name it `chat-history.pdf`.
- If you made the PDF, put it inside `se-lab/Lab-4/` and run:

bash
```
git add Lab-4/chat-history.pdf
git commit -m "Add LLM chat history"
git push
```

If your teacher asked for a link instead, submit the share link along with your repo link.

Before you submit (2 minutes):

- Run `python main.py` inside `Lab-4` once and play a few shots.
- Run `python -m unittest -v`. You should see 14 tests marked OK.
- Know the one-line answer to "what was the bug?" The AI returned 1-based text like `"2,3"`, while the board stored 0-based tuples like `(1,2)`. Because of that, AI hits were never detected, and repeat shots weren't blocked.

If any command gives an error, paste it here and I'll fix it.
this is the repo i want to push into - https://github.com/dhanushss05/SE-LAB and i do hv git in my mac and loaction of the folder is /Users/dhanushsulthan/Desktop/SE_lab/se\ lab4/se-lab
i m alr in the folder in my terminal
Check whether the SE-LAB repo already has content
Your SE-LAB repo already has Lab1, Lab2 and Lab3 in it, so a plain push will be rejected, and a force push would delete them. Let me test the safe way first.
Ran 2 commands
Your repo keeps each lab as `LabN/<name>/` (Lab1/Dhanush, Lab3/Vivaan, and so on). So I'll put this one in `Lab4/Dhanush/` to match. If you'd rather keep `Lab-4`, tell me.
Shared a file, ran a command
Download `se-lab-final.zip` to your Downloads folder. It replaces the earlier zip. It already includes your Lab1–3 and adds Lab 4 as 9 new commits on top, so nothing gets overwritten.

Then paste these into your terminal one by one (you're currently inside `se-lab`):
bash
```
cd ..
rm -rf se-lab
unzip ~/Downloads/se-lab-final.zip
cd se-lab
git push origin main
```

That should push straight through, with no merge and no force needed. If it asks you to log in, use your GitHub username and a personal access token, not your password.

Then check https://github.com/dhanushss05/SE-LAB. You should see `Lab4/Dhanush/` containing the code and a `videos` folder, and Lab1–3 should be unchanged.

Last step, the chat history: press Cmd+P on this chat, choose Save as PDF, and save it into `Lab4/Dhanush/` as `chat-history.pdf`. Then run:

bash

```
git add Lab4/Dhanush/chat-history.pdf
git commit -m "Add LLM chat history"
git push
```

If any step shows an error, paste it here.
